

Off Road Capability

The latest, state of the art, addition to the fleet is our off-road 8-wheel drive jetting / suction tanker with on board water recycler

OnSite are specialists in the assessment, cleaning and rehabilitation of pipes for both waste and clean water. Whilst much of this work is routine surveying and jetting, the assessment, cleaning and rehabilitation of culverts can be an entirely different proposition.

OnSite leads the way in culvert works through their dedicated culvert division and have been delivering this service for many years as framework contractors to the Environment Agency, Canal and Rivers Trust, Local Authorities and IDBS's.

Access can be a major issue for many companies who, either don't have the appropriate equipment and/or the experience and competence for undertaking culvert works. The equipment and expertise at OnSite's disposal means that we can often complete jobs faster, with overall lower costs and with less disruption than by traditional means.

OnSite's Tractor and off road jetting unit will get to culverts where standard vans and HGV's can't. This capability often reduces the need for installing temporary roadways or line closures. Combined with our remote reel HPWJ extension there's nowhere we can't reach.

OnSite floating their portable UV Lining equipment to site using a canal barge. This method of delivery saved the client over £25k alone on the cost of matting that had been specified for access across third party

OnSite's remote tracked CCTV unit can access locations that standard vehicles cannot get
